

Craig,

Please let the ICRC know what the City Demographer says below: the north-south river split in population is 60/40. There should be little justification for taking a sixth district south of the river.

Thanks,
David Orshalick
Allandale

David,

Okay, I just used GIS to determine that in 2010 the south of the river—north of the river split for the City of Austin's total population was 40.7% to 59.3%; this split changes only slightly as of April 2013 to 39.1% to 60.9%.

Thanks,

Ryan

Ryan,

Can you give me firmer percentages for the north-south river split in Austin's population for the 2010 census and today?

This info is for purposes of redistricting before the ICRC and the number and location of districts. The ICRC map currently has a sixth district (#9) crossing the river which is unnecessary since more than 60% of the population is north of the river.

Thanks Much,
David Orshalick

David,

Thanks very much for the email, so much better for me than the phone.

The split is roughly 40/60...35/65, south to north...I've got a crazy speaking engagement on Thursday morning that I'm dead lining for but if I get a moment, I'll crunch the GIS and give you specifics.

Thanks again,

Ryan
